

Our Greenhouse

Our Greenhouse

Our greenhouse, located in the Sandıklı district of Afyon, has been in operation since 2012 and continues its activities today. Covering an area of 14,500 m², with 11,000 m² of enclosed space, it is Turkey's first and only geothermal-heated, technologically advanced potted (container) fruit sapling production greenhouse equipped with automation systems.

Potted Saplings

Seeds and clonal rootstocks are planted in pots and placed in a growing environment. After the necessary cultural practices are carried out and the rootstocks reach a certain thickness, grafting is performed. Once the grafted material produces shoots, grows, and reaches a certain size, it is certified and made ready for sale to producers.
